**What is Semaglutide?**
Semaglutide is a glucagon-like peptide (GLP-1) analog. GLP-1 is a peptide hormone produced in the small intestine that stimulates insulin secretion and inhibits glucagon secretion, slows gastric emptying, and regulates appetite—all which aid in healthy and effective weight loss. L-Carnitine is added to give you energy while you are on your journey to healthy weight loss.

**What results can I expect?**
In a 68-week study* overweight or obese adults receiving weekly Semaglutide injections showed the following results:

- Average of 15% loss of total body weight (i.e. a 232 lb. man may lose an average of 35 lbs.)
  - Nearly 70% achieved a 10% weight loss threshold
  - 32% of participants lost at least 20% of their initial weight

*Side effects may occur and include the following: Low blood sugar (in people with type 2 diabetes), upper stomach, heartburn, burning gas, bloating, nausea, vomiting, stomach pain, loss of appetite, diarrhea, constipation, stomach flu symptoms, headache, dizziness, and tiredness.

*Results may vary based on treatment plan.

---

**When can I expect results?**
While patients will notice some significant body weight loss in the first month, the full benefits are usually fully noticed after three to six months of treatment. In 28 weeks, participants lost 16% of their body weight.
